The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-or of mRNA by using poly(T) as the sole primer. Since the 3'-outranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency off a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognishing different cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The polypeptide was isolated from human T98G cells and is useful for treating pancreatitis, shock, multiple organ failure and disseminated intravascular coagulation. The present sequence is that of an antisense primer used for cloning T98G cDNA coding for the full-length polypeptide. Sequence 48 BP; 2 A; 1 C; 1 G; 44 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matsubara K, Okubo K;

Claim 26; Page 17; 51pp; English.

Q95177 is a simple tandem repeat (STR) corresponding to the 2nd part

of wgla2. The STR can be used for treatment and diagnosis in human
and veterinary medicine, partic. for genetic characterisation,

mapping, linkage studies and analysis/diagnosis of acquired disease

alleles.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        requence - capable of forming ligatable hairpin structured promoter and transcribing target sequence, is sensitive and useful in medical diagnosis?

The sequence 1; 15pp; English.

The sequence is an example of a preferred T7 RNA polymerase promoter for use in the invention. There can be from 2 to 50 T's in the loop region. A probe sequence is ligated to the 3' end of the promoter region. Upon hybridisation of the probe to a target sequence and ligation of the hybridisation of the probe to a target sequence hairpin-forming sequence, the target sequence can be transcribed by T7 RNA polymerase. This allows the target sequence to be amplified (and detected) using a single oligonucleotide component (c.f. PCR). See also Q11759 and Q11761-Q11764.

Stample 1; Page 45; 117pp; English.

This is the nucleotide sequence for the PCR primer used in the All repeat sequence, which is used to demonstrate the processes described in the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and analysed.

The use of a polymerase gene from RNA viruses can provide for production of less mutagenic recombinant viruses. The recombinant viruses can be used in vaccines which have a reduced risk of loss or reduction of efficacy. The vaccines are used particularly for protecting swine against PRRSV. The high fidelity RNA polymerase gene can be used as a marker that allows organisms vaccinated with such a vaccine to be distinguished from organisms naturally infected with wild type strains of virus or other vaccines. The present sequence represents a PCR primer used in an example from the present invention.

PS Example 1; Page 44; 68pp; Japanese.
CC The present sequence is used in the course of the invention. The Specification describes a molecule for bringing together genotype with CC phenotype (in vitro virus). The molecule contains a nucleic acid contains a nucleic acid prenotype vortein fragment containing a protein participating in CC fragment having a base sequence corresponding to a genotype, covalently condition to a protein part via a puromycin modely. The nucleic cold fragment preferably consists of RNA corresponding to the gene (free CC acid fragment preferably consists of RNA corresponding to the gene (free CC adapter (such as a DNA-TRNA hybrid containing an anticodon corresponding to the terminator codon), a spacer (such as two-stranded DNA), a peptide containing and a puromycin-containing cap containing cap to the terminator codon of the gene) and a puromycin-containing cap capable of binding to an amino acid residue. Translation of the virus is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         δð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences of in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences of as a means of diagnosing abnormal cell function or for sequences as a means of diagnosing abnormal cell function or for Sequence 61 BP; 23 A; 12 C; 14 G; 12 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               88888888
PT Sequencing nucleic acid by mass spectrometric analysis - for detecting nucleic acids, telomerase activity, oncogene mutations, or pr detecting nucleic sequences, for diagnosis of disease ps Example 1; Page 318; 478pp; English.

CC A process has been developed for determining the sequence of a target cucleic acid. The process comprises: (1) generating at least two creaments (F) from the target nucleic acid; and (1) analysing F by comess spectrometry (MS). The sequences in V39483 to V39592 are specifically claimed primers for use in the mass spectrometric analysis co f the above process. The process is used to detect genetic diseases cofficially claimed primers for use in the mass spectrometric analysis coffices, cystic fibrosis and many others) or chromosomal abnormalities comparisition; infections and cancers; also for establishing cidentity and heredity. Particular applications are diagnosis of neuroblastoma, detecting telomerase, determining family relationships can disposition; this process requires fewer specific reagents can is better suited to automation. Extended primers are shorter; cand is better suited to automation. Extended primers are shorter; colligonucleotide used in an example from the present invention.

The method is used in molecular evolutionary engineering to optimise function of a functional biopolymer such as an enzyme, antibody or ribozyme, or to generate new functionality. The virus can be used for the functional optimisation of nucleic acid or protein sequences.

```
acid sequence (I) in a sample. The method comprises: (a) hybridising (I) to the probe ends of a probe having 2 free nucleic acid end parts, which CC are at least partially complementary to and capable of hybridising to at least 2 neighbouring regions of (I); (b) covalently connecting the cc ends of the hybridised probe with each other to form a circularised contacture; (c) washing under denaturing conditions, characterised in that the probe is provided with a cleavable or dissociable detectable function; (d) cleaving or dissociating the detectable function; (d) cleaving or dissociating the detectable function; (e) separating probes with connected ends from probes with non-connected ends by washing under denaturing conditions; and (f) detecting the presence and, if desired, location of the remaining probe as indicative of the presence of (I). The present sequence represents a padlock probe, can be used to detect, quantify and distinguish between sequence variants with regard to 1 or several (I) in a sample. It can be used to disease, for genetic linkage analysis of biallelic markers and to consist the presence of (I) by allowing a detectable consisted to that it reports the presence of (I) by allowing a detectable consisted to the presence of (I) by allowing a detectable consisted to the probe is designed so that it reports the probe has been cyclised in a target dependent linking reaction. It also provides for high specificity and consisted to background reduction.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 histologically-determined to be fully malignant prostate cancer cells. Double-stranded cDNA was ligated to Ecorl adaptors, 5 cycles of PCR applied to the cDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by David Krizman."
